

Brazilian E-Commerce Performance (Data Studio) - Interpretation

Data Filter (Period data - Jan, 1st 2018 until Aug, 31st 2018)

Business Health Metrics

Top 10 Product Categories by Ratings (Lowest Rated)

Key Highlight :

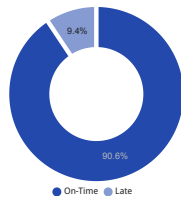

Three of the lowest-rated categories are physically large, heavy items: Furniture/Mattress/Upholstery (3.0), Office Furniture (3.5), and Air Conditioning (3.8) these 3 category potential due to Logistics Problem, need to check more further is it cause by 'broken', 'damaged', or 'late'.

The other major offenders are clothing categories: Female Clothing (3.0) and Sports Fashion (3.0), this category can cause by sizing issues, material quality, and the expectation vs. reality.

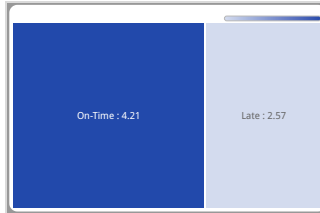

Actionable Insight:

"The Merchandising team need to immediately halt marketing spending in the Furniture and Women's Apparel categories until we conduct a rigorous supplier audit. The high sales volume in these categories is currently damaging our brand reputation."

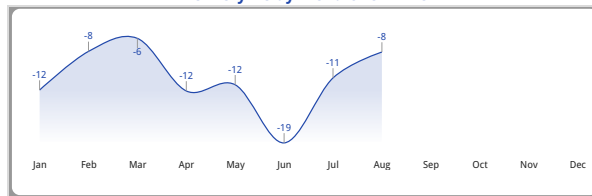

Delivery SLA Performance

The Cost of Late Deliveries (Satisfacti...

Delivery Delay Trend Over Time

Key Highlight :

Our logistics network is holding up decently, with 90.6% of orders delivered On-Time.

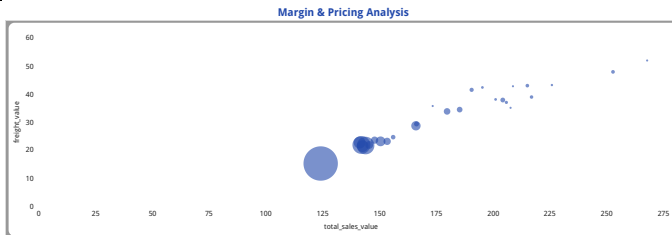

Looking at the Delivery Delay Trend, the numbers are deeply negative (ranging from -8 to -19). As we established, a negative delay means the package arrived early.

Actionable Insight:

Logistics is biggest lever for customer retention. That 9.4% failure rate is disproportionately dragging down our overall 4.0 rating. Need to identify which specific carriers or regions are responsible for that 9.4% and renegotiate their SLAs.

The Estimated Delivery Algorithm is severely broken. E-Commerce are giving customers wildly pessimistic shipping estimates at checkout. If a customer wants to buy a gift and the checkout screen says it will take 4 weeks, they will abandon the cart—even if our data shows we actually deliver it in 1 week. Tightening

these estimates will instantly boost our checkout conversion rate.

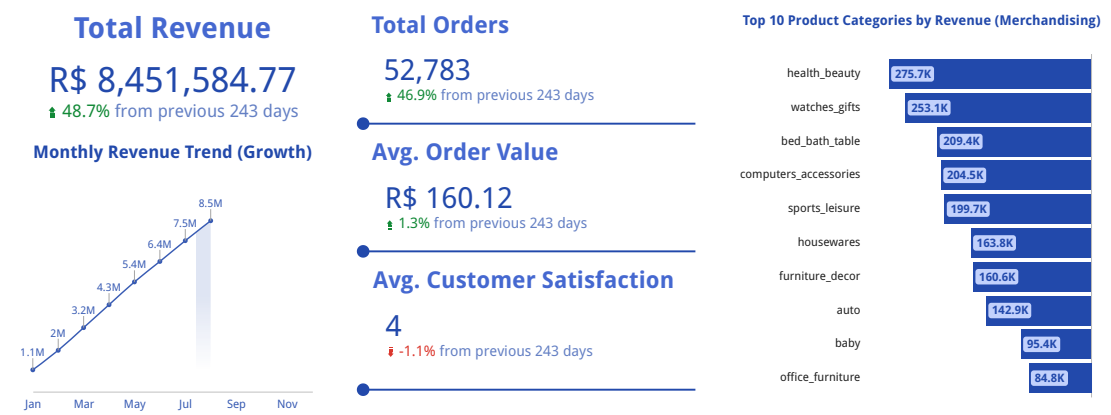

Key Highlight:

The Scatter Plot reveals our "sweet spot." There is a massive concentration of volume (the largest bubble) where the Total Sales Value is around R\$ 125 - 145, and the Freight Cost is kept exceptionally low (around R\$ 15 - 20)

As you move further to the right (higher priced items), shipping costs increase, but sales volume shrinks significantly.

Actionable Insight:

The Pricing team test a 'Subsidized/Free Shipping on Orders over R\$200' promotion to see if we can enlarge the small bubbles on the right side of the chart.
